Preface	xi
Part 0. Preliminaries	
Chapter 0. A first look at Banach and Hilbert spaces	3
§0.1. Warm up: Metric and topological spaces	3
§0.2. The Banach space of continuous functions	12
§0.3. The geometry of Hilbert spaces	16
§0.4. Completeness	22
§0.5. Bounded operators	22
§0.6. Lebesgue L^p spaces	25
§0.7. Appendix: The uniform boundedness principle	32
Part 1. Mathematical Foundations of Quantum Mechanics	
Chapter 1. Hilbert spaces	37
§1.1. Hilbert spaces	37
§1.2. Orthonormal bases	39
§1.3. The projection theorem and the Riesz lemma	43
§1.4. Orthogonal sums and tensor products	45
§1.5. The C^* algebra of bounded linear operators	47
§1.6. Weak and strong convergence	49
§1.7. Appendix: The Stone–Weierstraß theorem	51
Chapter 2. Self-adjointness and spectrum	55

§2.1. Some quantum mechanics	55
§2.2. Self-adjoint operators	58
§2.3. Quadratic forms and the Friedrichs extension	67
§2.4. Resolvents and spectra	73
§2.5. Orthogonal sums of operators	79
§2.6. Self-adjoint extensions	81
§2.7. Appendix: Absolutely continuous functions	84
Chapter 3. The spectral theorem	87
§3.1. The spectral theorem	87
§3.2. More on Borel measures	99
§3.3. Spectral types	104
§3.4. Appendix: The Herglotz theorem	107
Chapter 4. Applications of the spectral theorem	111
§4.1. Integral formulas	111
§4.2. Commuting operators	115
§4.3. The min-max theorem	117
§4.4. Estimating eigenspaces	119
§4.5. Tensor products of operators	120
Chapter 5. Quantum dynamics	123
§5.1. The time evolution and Stone's theorem	123
§5.2. The RAGE theorem	126
§5.3. The Trotter product formula	131
Chapter 6. Perturbation theory for self-adjoint operators	133
§6.1. Relatively bounded operators and the Kato–Rellich theorem	133
§6.2. More on compact operators	136
§6.3. Hilbert–Schmidt and trace class operators	139
§6.4. Relatively compact operators and Weyl's theorem	145
§6.5. Relatively form bounded operators and the KLMN theorem	149
§6.6. Strong and norm resolvent convergence	153
Part 2. Schrödinger Operators	
Chapter 7. The free Schrödinger operator	161
§7.1. The Fourier transform	161
§7.2. The free Schrödinger operator	167

§7.3. The time evolution in the free case	169
§7.4. The resolvent and Green's function	171
Chapter 8. Algebraic methods	173
§8.1. Position and momentum	173
§8.2. Angular momentum	175
§8.3. The harmonic oscillator	178
§8.4. Abstract commutation	179
Chapter 9. One-dimensional Schrödinger operators	181
§9.1. Sturm–Liouville operators	181
§9.2. Weyl's limit circle, limit point alternative	187
§9.3. Spectral transformations I	195
§9.4. Inverse spectral theory	202
§9.5. Absolutely continuous spectrum	206
§9.6. Spectral transformations II	209
§9.7. The spectra of one-dimensional Schrödinger operators	214
Chapter 10. One-particle Schrödinger operators	221
§10.1. Self-adjointness and spectrum	221
§10.2. The hydrogen atom	222
§10.3. Angular momentum	225
§10.4. The eigenvalues of the hydrogen atom	229
§10.5. Nondegeneracy of the ground state	235
Chapter 11. Atomic Schrödinger operators	239
§11.1. Self-adjointness	239
§11.2. The HVZ theorem	242
Chapter 12. Scattering theory	247
§12.1. Abstract theory	247
§12.2. Incoming and outgoing states	250
§12.3. Schrödinger operators with short range potentials	253
Part 3. Appendix	
Appendix A. Almost everything about Lebesgue integration	259
§A.1. Borel measures in a nut shell	259
§A.2. Extending a premeasure to a measure	263
§A.3. Measurable functions	268

§A.4. The Lebesgue integral	270
§A.5. Product measures	275
§A.6. Vague convergence of measures	278
§A.7. Decomposition of measures	280
§A.8. Derivatives of measures	282
Bibliographical notes	289
Bibliography	293
Glossary of notation	297
Index	301
